Your request status has changed to In review.

Volodymyr Dovhan Today 5:44 AM

Hello,

Thank you for the plugin and your contribution.

I found a few issues during the review. Please address them and resubmit the plugin for review.

1. Consider Adding GitHub Actions Support – It's Free and Highly Useful

Priority: LOW

Recommendation

Some of the tests run by the [Home | Moodle.org](#) plugins database can also be executed automatically using GitHub Actions on each commit to your GitHub repository. Enabling this helps ensure future changes continue to meet Moodle guidelines.

Setup:

- Download GitHub Actions CI configuration: [moodle-plugin-ci/gha.dist.yml at main · moodlehq/moodle-plugin-ci](#)
- Rename it to ci.yml
- Place it in .github/workflows (example: [https://github.com/danmarsden/moodle-mod_attendance/blob/MOODLE_311_STABLE/.github/workflows/ci.yml](#)) [Connect your Github account](#)

Once set up, each commit triggers tests and provides visual pass/fail feedback.

Optional pre-check:

- You can also run your plugin through [Plugin Reviewer](#) before submission. It can catch many common issues early, but it does not replace official Moodle validation and CI checks.

Documentation:

- [GitHub - moodlehq/moodle-plugin-ci: Helps running Moodle plugins analysis checks and tests under various CI environments.](#)
- [moodle-plugin-ci/gha.dist.yml at main · moodlehq/moodle-plugin-ci](#)
- [moodle-mod_attendance/.github/workflows/ci.yml at MOODLE_311_STABLE · danmarsden/moodle-mod_attendance](#)
- [Plugin Reviewer](#)

2. Incorrect repository name

Priority: LOW

Recommendation

Repository name doesn't follow the recommended pattern `moodle-{plugintype}_{pluginname}` for consistent developer experience. This is not a strong requirement, just an option to provide a consistent experience for other Moodle developers.

Documentation:

- [Moodle Marketplace Plugin Submission Guidelines | Code repository name](#)

Code excerpts:

```
1 Repository name 'moodle_report_studentgrades' does not match recommended 'moodle-report'
```

3. Missing plugin license file

Priority: BLOCKER

Approval blocker: Licensing/IP compliance

Recommendation

Plugin package does not include a license file in the plugin root. Include a LICENSE file so reviewers and users can verify the plugin licensing terms.

Documentation:

- [Moodle Marketplace Plugin Submission Guidelines | Licensing](#)

Code excerpts:

- File: LICENSE

```
1 Missing package-level license file in the plugin root.
```

4. External API Calls

Priority: HIGH

Approval blocker: External system privacy API

Recommendation

Plugin makes external API calls. If personal data may be transmitted, the Privacy Provider must declare this using `add_external_location_link()`. If no personal data is sent, document that decision clearly in the provider implementation.

Documentation:

-  [Privacy API | Moodle Developer Resources](#)
-  [Privacy API | Moodle Developer Resources](#)

Code excerpts:

- File: `classes/exporter.php`

```
1  928:      $json_data = json_encode($data);
2  930:      $response = $curl->post($url, $json_data);
3  931:      $info = $curl->get_info();
```

- File: `classes/privacy/provider.php`

```
1  External API call patterns found in: classes/exporter.php. Privacy provider does not de
```

5. Deprecated `print_error()` usage

Priority: HIGH

Recommendation

Plugin uses deprecated `print_error()` function. In newer Moodle versions this legacy API is removed, so this can become an undefined function runtime failure. Replace it with throw new `moodle_exception(...)` or a more specific supported exception, using language strings from the plugin language pack.

Documentation:

- [Moodle Marketplace Plugin Submission Guidelines | Coding](#)

Code excerpts:

- File: `download_pdf.php`

```
1  15: require_once(__DIR__ . '/lib.php');
2  16: if (!report_studentgrades_can_access_user($userid)) {
3  17:     print_error('nopermissions');
4  18: }
```

6. PARAM_RAW Security Risk

Priority: HIGH

Approval blocker: Security guidelines

Recommendation

Plugin uses `PARAM_RAW` for parameter validation. `PARAM_RAW` should only be used when there is no other option and when strict validation/cleaning is performed elsewhere. In most cases, use specific parameter types (for example: `PARAM_INT` for integers, `PARAM_TEXT` for plain text, `PARAM_ALPHA`/`PARAM_ALPHANUM` for constrained formats) to reduce XSS and injection risk.

Documentation:

-  [Security | Moodle Developer Resources](#)

Code excerpts:

- File: `download_pdf.php`

```
1 5: $userid = optional_param('userid', $USER->id, PARAM_INT);
2 6: $html_content = optional_param('html_content', '', PARAM_RAW); // RAW to allow HTML
3 7: $action = optional_param('action', '', PARAM_ALPHA);
```

7. Hard-coded language strings

Priority: MEDIUM

Recommendation

User-facing text is hard-coded in the source code instead of using Moodle's string API (`get_string()`). This prevents translation.

Documentation:

- [Moodle Marketplace Plugin Submission Guidelines | Strings](#)

Code excerpts:

- File: `download_pdf.php`

```
1 35:     exit;
2 36: } else {
3 37:     echo "No content to export.";
4 38: }
```

- File: `index.php`

```
1 120:     'button',
2 121:     'Analyze & Email Me',
3 122:     array('type' => 'submit', 'class' => 'btn btn-info btn-lg')
```

- File: `ajax_ai.php`

```
1 50:         $response['success'] = false;
2 51:         $response['message'] = "Daily limit reached. Please wait $minutes_r
3 52:         echo json_encode($response);
```

8. Update Ajax implementation to External Services

Priority: MEDIUM

Recommendation

Plugin uses legacy AJAX patterns instead of External Services, missing improved security and compatibility with Moodle standards.

- How to fix:
 - Replace direct `ajax.php` endpoints with External Services in `classes/external/* + db/services.php`.

- Call services from JS via `core/ajax` with proper `methodName` and args.
- Keep validation/capability checks inside external API execute methods.

Documentation:

- [External Services | Moodle Developer Resources](#)
- [Writing a new service | Moodle Developer Resources](#)
- [AJAX | Moodle Developer Resources](#)

Code excerpts:

- File: `index.php`

```
1 153:         modal.setBody('<div class=\"text-center\" style=\"padding:20px;\">
2 155:         $.ajax({
3 156:             url: 'ajax_ai.php',
4 157:             method: 'GET',
```

- File: `ajax_ai.php`

```
1 1: <?php
2 2: define('AJAX_SCRIPT', true);
3 4: require_once(' ../ ../config.php');
```

9. Missing File Boilerplate Headers

Priority: MEDIUM

Recommendation

Plugin source files (PHP and JS including AMD source) are missing Moodle boilerplate license/header markers expected for plugin submissions.

- How to fix:
 - Add the standard Moodle boilerplate header at the top of each flagged source file.
 - When the header is fully absent, copy a complete boilerplate block instead of patching individual tags.
 - For all source files, include explicit `@copyright` and `@license` markers.

Documentation:

- <https://moodle.atlassian.net/wiki/external/ODRhYjAyNTY4NDVmNGJINjljN2ViMzkwYzdmYmlwMGI#Boilerplate>

Code excerpts:

- File: `ajax_ai.php`

```
1 Missing standard Moodle boilerplate header; add the full boilerplate block.
```

- File: `download_pdf.php`

```
1 Missing standard Moodle boilerplate header; add the full boilerplate block.
```

10. Potential performance issues with requests to DB

Priority: MEDIUM

Recommendation

The plugin fetches grade records and activity records inside recursive grade-tree loops. On users with many courses and grade items this creates repeated per-item database/API calls. Preload grade records for the user/course in bulk where possible, cache activity intros by module/item id, and pass the preloaded data through the rendering/export routines instead of fetching inside each loop iteration.

Documentation:

- <https://moodledev.io/docs/4.5/apis/core/dml#performance>

Code excerpts:

- File: `classes/exporter.php`

```
1 261:     private function process_grade_tree_children($children, $userid, $level = 0)
2 265:         foreach ($children as $key => $child) {
3 276:             $html .= $this->process_grade_tree_children($child['children']
4 304:                 $grade_grade = \grade_grade::fetch(array('itemid' => $grade_item->
5 308:                 $description = $this->get_activity_description($grade_item);
```

- File: `classes/exporter.php`

```
1 369:     private function calculate_category_total($category, $userid)
2 371:         $category_item = \grade_item::fetch(array('itemtype' => 'category', 'itemi
3 376:         $category_grade = \grade_grade::fetch(array('itemid' => $category_item->id
4 392:     private function get_course_total($userid, $courseid)
5 399:         $course_grade = \grade_grade::fetch(array('itemid' => $course_item->id, 'c
```

- File: `classes/exporter.php`

```
1 727:         $activity = $DB->get_record($grade_item->itemmodule, array('id' => $g
2 851:     private function extract_grade_tree_data($children, $userid)
3 855:         foreach ($children as $child) {
4 876:             $grade_grade = \grade_grade::fetch(array('itemid' => $grade_item->
5 884:                 'description' => $this->get_activity_description($grade_item)
```

11. Transition to Templates, Output API, and AMD JavaScript Modules

Priority: MEDIUM

Recommendation

Plugin uses mixed PHP/HTML rendering and inline/legacy JavaScript patterns. Consolidate rendering with Templates + Output API and move page/template JS into AMD modules.

- How to fix:
 - Move HTML markup from PHP echo/print blocks into Mustache templates under `templates/`.
 - Build a `templatedata` array in PHP and render with `$OUTPUT->render_from_template('<component>/<template>', $templatedata)`.

- Move inline/template JavaScript into `amd/src/<module>.js` and initialize via `$PAGE->requires->js_call_amd(...)`.
- Keep PHP focused on data retrieval and access checks; keep presentation in templates.

Documentation:

- <https://moodledev.io/docs/4.5/guides/templates>
- <https://moodledev.io/docs/4.4/apis/subsystems/output>
- <https://moodledev.io/docs/5.0/guides/javascript/modules>

Code excerpts:

- File: `index.php`

```
1 214:    ";
2 216:    $PAGE->requires->js_amd_inline($js);
3 217: }
```

12. Missing language string definitions

Recommendation

Missing language string definitions were detected. Please define missing strings in the plugin language file(s).

Code excerpts:

- File: `studentgrades/download_pdf.php`

```
1 x Missing required string (string_key: nopermissions, component: report_studentgrades,
```
